PRODUCTION AND NATURAL RESOURCES.

I.—APPROXIMATE ACREAGES UNDER THE VARIOUS CROPS.

The figures given in this table are estimates based on the results of the Censuses of Production, 1921 and 1924. The acreages are subject to considerable error, and cannot in any way be guaranteed accurate owing to the difficulty in obtaining exact information of the variable areas under village plantation. For this reason several of the figures are given in round numbers. The coconut area seems to be under estimated and is generally thought to be over 1,000,000 acres. Figures of gross produce are not given, as in the past, as they are not sufficiently accurate. The export figures of various products are given in pages O 67-116 of this volume.

Embilipitiya.—Sufficient quantity. A well provided. Good. Baths and lavatories are provided. By drains. Privies clean.

Kahawatta.—A reservoir in hospital holds 5,000 gallons. (Daily average sick in hospital 134.03.) From a natural spring on a hill about $\frac{1}{4}$ of a mile from hospital, water conveyed to the reservoir and from reservoir to the wards by pipes. Satisfactory. Drinking water is filtered before use. Two bathrooms are attached to each ward with a galvanized iron tub in bathroom, and water supplied by $2\frac{1}{2}$ -inch taps. Two latrines are attached to each ward with Doulton's squatting plates fixed to the floor level in each, and a bucket placed below. Fine fly-proof trap door placed behind in each. Buckets are removed twice daily in the morning and evening, and their contents buried far away from the hospital. Drain water carried away in open cement concrete drains.

Karawanella.—An unlimited quantity. Two wells in the hospital premises, and the Kelani river in the vicinity of the hospital. Pure well water alone is filtered for drinking purposes. There are separate bathrooms for males and females with tubs, and Kelani river in the vicinity also affords convalescent patients a resort for bathing. Dry-earth system. The excreta are removed and buried twice a day at some distance from the hospital.

Kegalla.—Water insufficient. Not more than two gallons to each patient per day. A well. A hand-power pump was fitted to well, but this went out of order and now water is drawn by hand. No water coolies allowed. Good. Water is brought by the latrine and burial coolies from a well situated within the hospital premises. Dry-earth. The excreta buried at a distance from the hospital and removed twice daily.

Kitulgala.—Unlimited quantity. Water is conveyed by pipes to a reservoir in the hospital from a spring half a mile away. The Bacteriologist and the Government Analyst have reported the water to be of excellent quality. Eight bathrooms with water service. Dry-earth system. Clean. Nil.

Kolonna.—(a) Water for cooking, washing, and other purposes sufficient. (b) Water for drinking sufficient but during dry season brought from outside hospital. (a) Stream behind the hospital for washing and bathing. (b) River further away for cooking and drinking. The hospital well has enough water for all purposes, but during the dry season it runs dry. Hard; boiled and filtered for drinking. (a) Patients bathe in the stream behind the hospital; those who are unable to go to the stream are much inconvenienced; water is brought for them in buckets from the stream. (b) Lavatories: water is brought in buckets from stream. Sewage. Dry-earth system. Excreta removed and buried twice a day at a distance from the hospital. Privies clean.

Rakwana.—Unlimited. Drinking water is obtained from a well, and the water is boiled and filtered before use. Good. Each ward has its own bathroom containing a zinc bath which is filled every morning with water. Dry-earth system of latrines. Buckets are emptied twice daily and the excreta are buried at a distance from the hospital.

Ratnapura.—Sufficient quantity. Water is supplied by means of pipes from a hill about half a mile from the hospital. Good. There are bathrooms for males and females most of whom prefer bathing in the river which runs by the hospital. No sewers. The latrines for male and female patients are conducted on the dry-earth system.

Undugoda.—A sufficient quantity. Natural spring. Pure. Water service is provided to the bathrooms by means of a system of pipes. Dry-earth. The excreta are buried at a distance from the hospital. Low Doultons plates fixed at floor level.

METEOROLOGY.

General Remarks.—There is a marked variation in climate between the different parts of Ceylon. In the low-country, with a mean temperature of the order of 80° F, a noticeable feature is the small range of both temperature and pressure. There is, however, wide divergence between the moist conditions in the south-west of the Island, where the average annual rainfall varies from 100 to over 200 inches, and the dry zone areas of the north, north-west, and south-east.

2. Altitudes up to 8,000 feet occur inland, and there the temperature is cooler, and shows a bigger range. There is a corresponding change in vegetation, and the conditions are altogether more akin to those in the temperate zone.

3. *Rainfall.*—The rainfall of 1925 was above the annual average over about three quarters of the island, though variations, whether above or below, were in general smaller than in 1924. Three depressions that occurred in January, March, and November, respectively, were chiefly responsible for this result, as the rainfall during the south-west monsoon was on the whole below its average in the areas where the averages are highest.

The chief areas in which the averages for the year were not reached were (1) on the south-west shoulder of the main hills round Hatton, and extending north-eastward to Hewaheta and northward to Ambegamuwa and thence westward to the northern part of the Kelani Valley, including Kitulgala, &c.; (2) a group of stations due south of Batticaloa; (3) a fairly wide strip of low-country extending on both sides of a line from Tabbowa (near Puttalam) through Anuradhapura to Trincomalee;

Carney once again heads the list with 251·7 inches, or 18·2 inches above its own average, followed by Watawala 241·7, Ingoya 224·0, and Kenilworth 221·6. At the other limit Ponparippu, 38·2, was just below Mannar Waterworks, 39·4, while the lowest average is still held by Marichchukkaddi, (34·5), with Ponparippu next, (37·2).

Temperature.—Nuwara Eliya and Hakgala were the only stations whose mean temperatures for the year differed from their annual average by more than half a degree. The station showing the highest mean shade temperature for the year was Trincomalee 83·1° F., and lowest Nuwara Eliya with 59·9° F. The figures for Colombo and Kandy were 80·6° F. and 76·3° F., respectively.

The highest shade temperature in air recorded during the year was 99·6° F. at Batticaloa on August 28. The highest on record is 103·7° F. at Trincomalee on May 12, 1890. The lowest this year was 29·6° F. at Nuwara Eliya (6,000 feet above sea level) on February 20, at which station 27·1° F. was recorded in 1914.

The highest shade temperature at Colombo in 1925 was 92·3° F. on March 5 and the lowest 63·4° F. on February 21.

The mean daily range, *i.e.*, the difference between the mean of the maximum and the mean of the minimum, was highest at Badulla, 18·2° F., and lowest at Galle, 8·0° F. At Colombo and Kandy it was 11·9° F. and 15·9° F., respectively.

The absolute range for the year, *i.e.*, the difference between the highest and the lowest readings actually recorded at any one station, was greatest at Nuwara Eliya 46·1° F. and lowest at Galle 19·6° F.

The air temperature (both wet and dry) are taken at a height of from 4½ to 5 feet above ground level in open sheds.

These sheds are all about 10–12 feet square and though not absolutely identical in dimensions are sufficiently similar for the results to be comparable, in each case the roof is supported by four corner pillars, usually of bricks, and the intermediate space is closed in with wire netting. In one or two cases a light blind has had to be added to prevent sunlight getting under the eaves in the early morning or late evening, but in no case is this obstruction enough to interfere appreciably with ventilation.

Photographs of several of the actual sheds can be seen in the frontispiece of the report for 1913.

In the above table the tendency for both extremes to occur at the same time of year is noteworthy, and calls attention to the fact that in the tropics variations in cloudiness have a greater importance relatively to variations in the sun's declination than is the case in the temperate zones.

TABLE VIII.—Percentage Humidity for 1925 calculated from the Dry and Wet Tables issued by the Indian Meteorological Department. Figures in ordinary type are from the 9.30 and 3.30 readings, and so derived from temperatures that are rigidly comparable to each other, but give no detail of night conditions. The figures in italics give the mean of the humidity as derived from the maximum temperatures and as derived from the minimum. This only admits of approximate physical interpretation, since the dry and wet thermometers do not necessarily reach their extreme values simultaneously. It is, however, a serviceable approximation for several purposes, as it does include an indication of the conditions at night.

TABLE X.—Offsets of the 9·30 and 15·30 Air Pressure Readings of the Year 1925 from the Average expressed in decimals of an inch of mercury.

Taking one millibar as roughly equal to 0·03 inch of mercury, it will be seen that offsets of as much as a millibar were very rare.

Table XII.—High Velocities of Wind at Colombo (Fort) during 1925.

This Table gives the times at which the highest velocities were recorded at Colombo (Fort). In the absence of recent Kew certificates for the instruments concerned, the numerical values below must only be accepted as approximations, roughly comparable among themselves, but not precise. The time given is Ceylon Standard Time, 5½ hours ahead of Greenwich. The instrument was occasionally out of action for periods of a few hours only.

Cases in which gusts or squalls are accompanied by sharp changes in direction are denoted by a*.

* This differs from the corresponding tables in previous Blue Books in being limited to the reports of twenty-four selected stations instead of dealing with over three hundred. The full table is included with the report of the Superintendent of the Colombo Observatory, obtainable at the Government Record Office, Colombo.

TABLE XIV.—Maximum amount of rain falling in any consecutive periods of 1, 2, 3, 4, &c., days during the year, for selected stations. This table replaces the table “Periods of Continuous Drought and Rain during the Year,” that appeared in reports previous to 1924. The stations selected are the sixteen principal stations, five stations that report rainfall daily, and, in addition, Carney and Watawala, representing that area on the south-west slopes of the hills, which receives the heaviest rain during the South-west Monsoon, St. Martin’s, representative of the corresponding area on the other side of the hills for the North-east Monsoon, and Koslanda, just below the steep south-eastern shoulder of the hill country.

The figure under each number represents the maximum amount of rain falling on that number of consecutive days during the year, the different figures for each station not necessarily referring to the same wet spell. For example, at Watawala, 22·65 inches fell on 7 days, from May 12 to 19, while 23·69 inches fell on 8 days, from September 29 to October 7.

The series is terminated for each station when the intensity of rainfall falls below 2 inches per day. In the case of wet spells occurring in December and January, they are considered as belonging to the year in which the greater part of the rain fell. Some of the figures given for St. Martin’s this year are derived from wet spells commencing in December, 1924.

[The rainfall day is not the calendar day, but from the observation of one morning to that of the succeeding morning.]

TABLE XV.—Rainfalls of 5 inches or over in 24 hours during 1925. This corresponds to table XV. in the 1924 report, but, in order to save space, heavy rainfalls at different places on the same day are now grouped together, by steps of an inch. Thus 5–6 includes all falls from 5·00 to 5·99 inches inclusive, and similarly for the other steps. The rainfall day is in every case taken as from the measurement of one morning to that of the next, even if pluviograph records are available. or if, as in the case with the principal stations, a second reading is taken in the afternoon.

QUESTIONS.

At bar or entrance, what is—

- (1) The minimum width ?
- (2) The minimum navigable depth, low water ordinary spring tide ?

Note.—If between the entrance and the deep sea there are bars or shoals where a lesser depth occurs than the minimum indicated above, a list of such obstructions and of the depths over them (low water ordinary spring tide) should be given.

2. In the approach channel from bar or entrance to berthing accommodation, what is—

- (1) The minimum and maximum width ?
- (2) The minimum and maximum depth, low water ordinary spring tide ?

3. What is—

- (1) The rise and fall of tides—
 - (a) Ordinary springs ?
 - (b) Ordinary neaps ?
- (2) The rise of ordinary neaps above low water ordinary spring tide ?

4. What is the maximum available depth of water—

- (a) At piers or wharves low water ordinary spring tide ?
- (b) In the case of enclosed docks in the entrance locks, if any, and at dock quays, high water ordinary neap tide ?

5. What are the respective lengths of piers, wharves, or (in the case of enclosed docks) dock quays, where the maximum depth of water, referred to in Question 4, exists ?

What percentage does the total of these lengths bear to the total accommodation at the port ?

6. What are the dimensions (length, loaded draught, and beam at that draught) of the largest vessels which, under existing circumstances, can be—

- (a) Berthed alongside any pier or wharf (low water ordinary spring tide) ?
- (b) In the case of enclosed docks—
 - (1) Admitted direct to ; or
 - (2) Admitted through the entrance lock of any important dock or docks, high water ordinary neap tide ?

7. What are the dimensions (length, breadth, and depth over sill high water ordinary neap tide) of the largest dry dock or floating dock in the port ?

8. Are operations in progress to increase the depth of water—

- (a) At the entrance and in the approach channel ?
- (b) In the case of enclosed docks at the entrance lock, if any, of any important dock or docks ?
- (c) At the principal berths to 40 feet at low water ordinary spring tide (in the case of the berths at enclosed docks, high water ordinary neap tide), and is accommodation being provided for vessels 1,000 feet in length and of 100 feet beam ?

If not, to what extent is deepening being effected, and for vessels of what dimensions (length, draught, and beam at that draught) is accommodation being provided or in contemplation ?
